Issues in geophysics:

- different types of waves on seismic "images"
  - appear hyperbolic [layers], linear [noise] (and parabolic)
- not the standard "mid-amplitude random noise problem"
- no contours enclosing textures, more the converse
- ▶ kind of halfway between signals and images (1.5D)
- yet local, directional, frequency-limited, scale-dependent structures to separate

Motivations ○●	Intro. 000000	Early days 0	Oriented & geometrical	Far away from the plane 0	End o

# Agenda

- ► To survey 15 years of improvements in 2D wavelets
  - spatial, directional, frequency selectivity increased
  - sparser representations of contours and textures
  - from fixed to adaptive, from low to high redundancy
  - generally fast, practical, compact (or sparse?), informative
  - ▶ 1D/2D, discrete/continuous hybridization
- Outline
  - introduction + early days ( $\leq 1998$ )
  - fixed: oriented & geometrical (selected):
    - $\pm$  separable (Hilbert/dual-tree wavelet)
    - isotropic non-separable (Morlet-Gabor)
    - anisotropic scaling (ridgelet, curvelet, contourlet, shearlet)
  - (hidden bonuses):
    - adaptive, lifting, meshes, spheres, manifolds, graphs
  - conclusions

# Images are pixels (but...):

A review in an active research field:

- (partly) inspired by:
  - early vision observations [Marr et al.]
  - sparse coding: wavelet-like oriented filters and receptive fields of simple cells (visual cortex) [Olshausen *et al.*]
  - a widespread belief in sparsity
- motivated by first successes (JPEG 2000 compression)
- aimed either at pragmatic or heuristic purposes:
  - known formation model or unknown information content
- developed through a legion of \*-lets (and relatives)

Motivations	Intro.	Early days	Oriented & geometrical	Far away from the plane	End
00	000000	0	00000000	0	0
12/28					

### Images are pixels, wavelets are legion

#### Room(let) for improvement:

Activelet, AMlet, Armlet, Bandlet, Barlet, Bathlet, Beamlet, Binlet, Bumplet, Brushlet, Caplet, Camplet, Chirplet, Chordlet, Circlet, Coiflet, Contourlet, Cooklet, Craplet, Cubelet, CURElet, Curvelet, Daublet, Directionlet, Dreamlet, Edgelet, FAMlet, FLaglet, Flatlet, Fourierlet, Framelet, Fresnelet, Gaborlet, GAMlet, Gausslet, Graphlet, Grouplet, Haarlet, Haardlet, Heatlet, Hutlet, Hyperbolet, Icalet (Icalette), Interpolet, Loglet, Marrlet, MiMOlet, Monowavelet, Morelet, Morphlet, Multiselectivelet, Multiwavelet, Needlet, Noiselet, Ondelette, Ondulette, Prewavelet, Phaselet, Planelet, Platelet, Purelet, QVlet, Radonlet, RAMlet, Randlet, Ranklet, Ridgelet, Riezlet, Ripplet (original, type-1 and II), Scalet, S2let, Seamlet, Seislet, Shadelet, Spikelet, Spinelet, Starlet, Sterlet, Storkeslet, SURE-let (SURElet), Surfacelet, Surflet, Symmlet, S2let, Tetrolet, Treelet, Vaguelette, Wavelet-Vaguelette, Wavelet, Warblet, Warplet, Wedgelet, Xlet, not mentioning all those not in -let!

#### Now, some reasons behind this quantity

### Images are pixels, but altogether different

Figure : Different kinds of images

Motivations	Intro.	Early days	Oriented & geometrical	Far away from the plane	End
00	000000	0	00000000	0	0
12/28					

### Images are pixels, but might be described by models

"Template" image decomposition models:

edge cartoon + texture [Meyer-2001]:

$$\inf_{u} E(u) = \int_{\Omega} |\nabla u| + \lambda ||v||_{*}, f = u + v$$

edge cartoon + texture + noise [Aujol-Chambolle-2005]:

$$\inf_{u,v,w} F(u,v,w) = J(u) + J^*\left(\frac{v}{\mu}\right) + B^*\left(\frac{w}{\lambda}\right) + \frac{1}{2\alpha} \|f-u-v-w\|_{L^2}$$

heuristically: piecewise-smooth + contours + geometrical textures + noise (or unmodeled)

Motivations	Intro.	Early days	Oriented & geometrical	Far away from the plane	End
00	000000	0	00000000	0	0
12/28					

Images are pixels, but resolution/scale helps with models

#### Coarse-to-fine and fine-to-coarse relationships

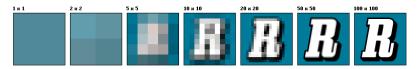

Figure : Notion of sufficient resolution [Chabat et al., 2004]

- discrete 80's wavelets were "not bad" for: piecewise-smooth (moments) + contours (gradient-behavior) + geometrical textures (oscillations) + noise (orthogonality)
- yet, not enough with noise, complicated images (poor sparsity decay)

Motivations	Intro.	Early days	Oriented & geometrical	Far away from the plane	End
00	000000	0	00000000	0	0
12/28					

### Images are pixels, but decay with regularity

#### Compressibility vs regularity: MSE with M-term approximation

- ▶ 1D
  - piecewise  $C^{\alpha} \rightarrow O(M^{-2\alpha})$
- ► 2D
  - $C^{lpha} 
    ightarrow O(M^{-lpha})$  (standard wavelets)
  - piecewise  $C^{\alpha}/C^{\alpha} \rightarrow O(M^{-1})$  (standard wavelets)
  - piecewise  $C^2/C^2 \rightarrow O(M^{-2})$  (triangulations)
- Notes:
  - very imprecise statements, many deeper results
  - ▶ piecewise  $C^2/C^2 \rightarrow O(M^{-2}f(M))$  w/ directional wavelets?
  - do much better with other regularities ( $\alpha \neq 2$ , BV)?

00	000000	0	00000000	0	0
14/28					

### Images are pixels, but resolution/scale helps

To catch important "objects" in their context

- use scales, pyramidal or multiresolution schemes,
- combine w/ different description/detection/modeling:
  - smooth curve or polynomial fit, oriented regularized derivatives (Sobel, structure tensor), discrete (lines) geometry, parametric curve detectors (e.g. Hough transform), mathematical morphology, empirical mode decomposition, local *frequency estimators*, Hilbert and Riesz (analytic and monogenic), quaternions, Clifford algebras, optical flow, smoothed random models, generalized Gaussian mixtures, warping operators, etc.

00	000000	0	00000000	0	0
15/28					

### Images are pixels, and need efficient descriptions

Depend on application, with sparsity priors:

compression, denoising, enhancement, inpainting, restoration, contour detection, texture analysis, fusion, super-resolution, registration, segmentation, reconstruction, source separation, image decomposition, MDC, learning, etc.

#### Isotropic wavelets (more axiomatic)

#### Consider

Wavelet  $\psi \in \mathbb{L}^2(\mathbb{R}^2)$  such that  $\psi(\mathbf{x}) = \psi_{rad}(||\mathbf{x}||)$ , with  $\mathbf{x} = (x_1, x_2)$ , for some radial function  $\psi_{rad} : \mathbb{R}_+ \to \mathbb{R}$  (with adm. conditions).

#### Decomposition and reconstruction

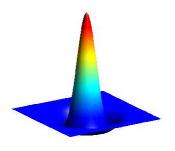

For  $\psi_{(\boldsymbol{b},\boldsymbol{a})}(\boldsymbol{x}) = \frac{1}{a}\psi(\frac{\boldsymbol{x}-\boldsymbol{b}}{a})$ ,  $W_f(\boldsymbol{b},\boldsymbol{a}) = \langle \psi_{(\boldsymbol{b},\boldsymbol{a})}, f \rangle$  with reconstruction:

$$f(\mathbf{x}) = \frac{2\pi}{c_{\psi}} \int_{0}^{+\infty} \int_{\mathbb{R}^{2}} W_{f}(\mathbf{b}, \mathbf{a}) \psi_{(\mathbf{b}, \mathbf{a})}(\mathbf{x}) d^{2}\mathbf{b} \frac{d\mathbf{a}}{\mathbf{a}^{3}}$$

if  $c_{\psi} = (2\pi)^2 \int_{\mathbb{R}^2} |\hat{\psi}(\boldsymbol{k})|^2 / \|\boldsymbol{k}\|^2 \, \mathrm{d}^2 \boldsymbol{k} < \infty.$

To tackle orthogonal DWT limitations

► 1D, orthogonality, realness, symmetry, finite support (Haar) Approaches used for simple designs (& more involved as well)

- relaxing properties: IIR, biorthogonal, complex
- *M*-adic MRAs with *M* integer > 2 or M = p/q
- hyperbolic, alternative tilings, less isotropic decompositions
- with pyramidal-scheme: steerable Marr-like pyramids
- relaxing critical sampling with oversampled filter banks
- complexity: (fractional/directional) Hilbert, Riesz, phaselets, monogenic, hypercomplex, quaternions, Clifford algebras

## Directional, non-separable

Non-separable decomposition schemes, directly n-D

- non-diagonal subsampling operators & windows
- non-rectangular lattices (quincunx, skewed)
- non-MRA directional filter banks
- steerable pyramids
- M-band non-redundant directional discrete wavelets
- served as building blocks for:
  - contourlets, surfacelets
  - first generation curvelets with (pseudo-)polar FFT, loglets, directionlets, digital ridgelets, tetrolets

Motivations	Intro. 000000	Early days 0	Oriented & geometrical	Far away from the plane 0	End 0
21/28					

## Directional, non-separable

Directional wavelets and frames with actions of rotation or similitude groups

$$\psi_{(\boldsymbol{b},\boldsymbol{a},\boldsymbol{\theta})}(\boldsymbol{x}) = \frac{1}{\boldsymbol{a}} \psi(\frac{1}{\boldsymbol{a}} R_{\boldsymbol{\theta}}^{-1}(\boldsymbol{x} - \boldsymbol{b})),$$

where  $R_{\theta}$  stands for the 2  $\times$  2 rotation matrix

$$W_f(\boldsymbol{b}, \boldsymbol{a}, \theta) = \langle \psi_{(\boldsymbol{b}, \boldsymbol{a}, \theta)}, f \rangle$$

inverted through

$$f(\boldsymbol{x}) = c_{\psi}^{-1} \int_{0}^{\infty} \frac{\mathrm{d}\boldsymbol{a}}{\boldsymbol{a}^{3}} \int_{0}^{2\pi} \mathrm{d}\theta \int_{\mathbb{R}^{2}} \mathrm{d}^{2}\boldsymbol{b} \quad W_{f}(\boldsymbol{b}, \boldsymbol{a}, \theta) \ \psi_{(\boldsymbol{b}, \boldsymbol{a}, \theta)}(\boldsymbol{x})$$

Additional transforms

- previously mentioned transforms are better suited for edge representation
- oscillating textures may require more appropriate transforms
- examples:
  - wavelet and local cosine packets
  - best packets in Gabor frames
  - brushlets [Meyer, 1997; Borup, 2005]
  - wave atoms [Demanet, 2007]

Motivations	Intro. 000000	Early days o	<b>Oriented &amp; geometrical</b>	Far away from the plane 0	End 0

# Lifting representations

Lifting scheme is an unifying framework

- to design adaptive biorthogonal wavelets
- use of spatially varying local interpolations
- at each scale j,  $a_{j-1}$  are split into  $a_i^o$  and  $d_i^o$
- wavelet coefficients d<sub>j</sub> and coarse scale coefficients a<sub>j</sub>: apply (linear) operators P<sup>λ<sub>j</sub></sup><sub>j</sub> and U<sup>λ<sub>j</sub></sup><sub>j</sub> parameterized by λ<sub>j</sub>

$$d_j = d_j^o - \mathcal{P}_j^{\lambda_j} a_j^o$$
 and  $a_j = a_j^o + U_j^{\lambda_j} d_j$ 

lt also

- guarantees perfect reconstruction for arbitrary filters
- adapts to non-linear filters, morphological operations
- can be used on non-translation invariant grids to build wavelets on surfaces

Motivations	<b>Intro</b> . 000000	Early days 0	Oriented & geometrical	Far away from the plane 0	End o
23/28					

# Lifting representations

$$d_j = d_j^o - P_j^{\lambda_j} a_j^o$$
 and  $a_j = a_j^o + U_j^{\lambda_j} d_j$

# Lifting representations

Extensions and related works

- adaptive predictions:
  - ▶ possibility to design the set of parameter \u03c0 = {\u03c0\_j}\_j to adapt the transform to the geometry of the image
  - λ<sub>j</sub> is called an association field, since it links a coefficient of a<sup>o</sup><sub>j</sub> to a few neighboring coefficients in d<sup>o</sup><sub>i</sub>
  - each association is optimized to reduce the magnitude of wavelet coefficients d<sub>j</sub>, and should thus follow the geometric structures in the image
  - may shorten wavelet filters near the edges
- grouplets: association fields combined to maintain orthogonality

# Conclusion: on a (frustrating) panorama

Take-away messages anyway?

If you only have a hammer, every problem looks like a nail

- Is there a "best" geometric and multiscale transform?
  - no: intricate data/transform/processing relationships
    - more needed on asymptotics, optimization, models
  - maybe: many candidates, progresses awaited:
    - "so  $\ell_2$ "! Low-rank ( $\ell_0/\ell_1$ ), math. morph. (+, × vs max, +)
  - yes: those you handle best, or (my) on wishlist
    - mild redundancy, invariance, manageable correlation, fast decay, tunable frequency decomposition, complex or more
